

Address Nodes

Collecting, storing, and maintaining address data is NOT as simple as one would imagine. As with most counties and municipalities all over the country, we here in Clinton County had multiple databases, paper, scans, archived GIS Data as well as LBRS data to deal with. Our goal was to merge the best of each of these (sometimes) disparate datasets together to create the ultimate MAD – Master Address Database – with our GIS Program.

This presentation will focus on Address Points; different types of addresses, what IS an address, and the difference between an address and a coordinate.
